

SE Lab 2

Name: Anirudh Dharane

SRN: PES1UG24CS555

Section: J

Jira Submission:

Backlogs and User stories:

Sprint board:

Burndown chart:

Reflection Question:

1. Did your estimations reflect the actual effort?

Yes, using Fibonacci story points provided a clear relative scale for complexity. Assigning lower points (3–5) to straight-forward UI tasks like therapist selection and higher points (8) to

complex backend logic like pseudo-ID generation accurately reflected the technical uncertainty and effort involved.

2. Was your backlog well-prioritized?

Yes, high-impact features such as anonymized pseudo-ID creation (FR-001) and crisis escalation (FR-005) were prioritized highest because they represent critical trust and safety requirements. Routine options like session rescheduling (FR-004) were set to medium priority.

3. How did your simulated sprint align with your plan?

The sprint execution aligned smoothly with the initial capacity. Moving items systematically from To Do → In Progress → Done ensured that target velocity was maintained without unexpected bottlenecks.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart illustrated how remaining story points decreased as tasks moved to completion. A steady drop down toward zero indicates accurately estimated scope, whereas sharp drops signal that tasks could be broken down into even smaller, continuous deliverables in future sprints.
